

AbstractA Process, Configuration Server, Signalling Server,
Computer Program and Storage Medium
for the Generation of Service Function Modules

5

The invention relates to a process for generating service function modules for a signalling server which can provide signalling functions for the control of communications connections via a communications network, in particular multimedia communications connections via a packet switching data network by means of the following steps:

10

- the making available of procedure modules for the detection, processing and formation of signalling messages of a communications network by a configuration server,

15

- display of the procedure modules in the form of symbols by a user interface on the configuration server,

20

- detection of a selection and arrangement, predetermined by a user, of the symbols of the procedure modules at the user interface,
- combining of the procedure modules to form a service function module by the configuration server in a manner predetermined by the selection and arrangement of the relevant symbols of the procedure modules at the user interface and

25

- the making available of the service function module by the configuration server for the signalling server, and to a configuration server, a signalling server, a

30

computer program and a storage medium therefor.
